A case of vitalizing hospital-centered medical device R&D

Abstract:

Vitalizing hospital-centered medical device R&D is an important factor in promoting the development of the medical industry. To achieve this goal, cooperation between hospitals and medical device manufacturers has been strengthened in recent years. In this presentation, we will introduce the case of research support and infrastructure construction at Chungnam National University Hospital for hospital-centered medical device R&D.

First, there are cases where medical device manufacturers identify the needs of hospitals and develop new products in close cooperation with hospitals. This allows medical device manufacturers to accurately identify the functions and characteristics that hospitals need and develop products that reflect them. Second, there are examples of hospitals building the infrastructure for new medical device development. Hospitals can build infrastructure such as laboratories and good manufacturing practice (GMP) facilities to provide medical device companies and individual researchers with the environment they need for medical device research and development.
